7-Day Liquidity Impact Report

Example buyer delivery for OP / Superchain teams

PRIMARY BUYER-FACING ARTIFACT

Example Protocol - OP / Superchain Liquidity Impact

This example shows the paid delivery format for a 7-day report: source-backed DEX activity, fee output, weak markets, recommendations, payment boundary, and handoff rules.

Package	7-day Diagnostic Report
Price	\$500
Accepted payment	OP / USDT / USDC
Timeline	7 days after scope and initial payment
Handoff	PDF-ready report, Markdown, CSV evidence, source audit

What the buyer gets

A concise decision memo that answers whether a protocol's OP / Superchain liquidity is creating measurable DEX outcomes and what to do next.

EXECUTIVE ANSWER

Liquidity is active, but two markets need review before scaling incentives.

30d DEX volume \$128.4M	30d fees \$216.8K	Fee / volume 0.17%
Watch markets 2	Source confidence 82 / 100	Report price \$500

The example protocol shows enough public Superchain activity for a deeper buyer conversation: 30d DEX volume is visible, fee output can be checked, and source coverage is strong enough to separate facts from assumptions. The recommendation is to continue strong markets, adjust weak fee-capture markets, and investigate missing fee fields before increasing budget.

Market activity snapshot

Signal	Example output	Buyer use
DEX activity	\$128.4M 30d volume on primary market	Confirms real usage, not only deposited liquidity
Fee output	\$216.8K 30d fees where public feeds expose data	Checks whether activity creates measurable economic output
Fee / volume	0.17% on primary market	Compares capital efficiency across markets
Watch markets	2 markets need review	Prioritizes follow-up before additional spend
Source gaps	Unavailable values are disclosed	Prevents hidden assumptions in stakeholder updates

RECOMMENDED ACTIONS

Continue, adjust, investigate, then decide.

Action	Condition	Example next step
Continue	Strong volume, visible fees, healthy source confidence	Track weekly and prepare a concise stakeholder update
Adjust	Volume is present but fee output is weak	Review whether incentives attract low-quality flow
Investigate	Missing fee fields or negative trend	Refresh public sources before making paid conclusions
Pause	No reliable public evidence	Do not claim impact; re-scope to source audit or private data review

Methodology boundary

The report uses public endpoints, labels unavailable values directly, and keeps recommendations conservative when confidence is low. It does not replace DeFiLlama, Dune, Artemis, or Token Terminal. It packages public data into a buyer-readable decision memo.

Source	Used for	Boundary
DefiLlama chains	Network TVL context	Public chain-level values only
DefiLlama DEX overview	DEX volume and market rows	Protocol matching depends on public feed labels
DefiLlama fees overview	30d fees where exposed	Unavailable fee fields are not manually estimated

COMMERCIAL HANDOFF

Payment, scope, and delivery rules

Gate	Rule
Scope confirmation	Protocol, networks, metrics, format, deadline, and contact route are agreed before work starts.
Payment route	Accepted payment is OP, USDT, or USDC by agreed wallet and network. Wallet details are shared after scope confirmation.
Start condition	Work starts after the initial payment is confirmed.
Final handoff	Final PDF, Markdown, CSV, and source notes are released after final payment is confirmed.

What is not included

This report is not financial advice, not investment advice, not tax advice, not a smart-contract security audit, and not an official OP assessment. New protocols, private data work, custom dashboards, extra revisions, or legal/compliance documents are separate scope.

Buyer message

I can deliver this 7-day Liquidity Impact Report for \$500. If it is useful, a deeper evidence pack is \$1,500-\$3,000 and monthly monitoring starts from \$1,500/mo.
